

Microsoft Access Project Specification

❖ Task: Design & develop **Hospital Management System**

1. Write a report based on the given template
2. Draw an ERD for your system with detailed explanation of fields, data type, validation, format, lookup field...
3. Attach a screenshot of database relationship
4. Input sample data, at least 10 records for each table
5. Develop a database management system that has:
 - Tables + Queries
 - Forms + Report
 - Mainboard

❖ System Overview:

The **Hospital Management System** is designed to handle basic hospital operations like patient registration, doctor appointments, and billing. The system will keep track of patient details, their appointments, and the treatment charges.

❖ Entities and Attributes:

• Patient

- **PatientID**: Unique identifier for each patient (Primary Key).
- **Name**: Full name of the patient.
- **DOB**: Date of birth of the patient.
- **Gender**: Gender of the patient.
- **PhoneNumber**: Contact number of the patient.

- **Doctor**
 - **DoctorID**: Unique identifier for each doctor (Primary Key).
 - **Name**: Full name of the doctor.
 - **Specialization**: Doctor's area of expertise (e.g., General Practitioner, Cardiologist).
- **Appointment**
 - **AppointmentID**: Unique identifier for each appointment (Primary Key).
 - **PatientID**: Linked to the **Patient** table (Foreign Key).
 - **DoctorID**: Linked to the **Doctor** table (Foreign Key).
 - **AppointmentDate**: Date and time of the appointment.
- **Billing**
 - **BillID**: Unique identifier for each bill (Primary Key).
 - **PatientID**: Linked to the **Patient** table (Foreign Key).
 - **Amount**: Total cost for the treatment.
 - **BillDate**: Date the bill was created.

❖ **Features:**

1. **Patient Registration:**
 - Add and store basic patient details (name, contact, and date of birth).
2. **Doctor Management:**
 - Add doctors and their specializations.
3. **Appointment Scheduling:**
 - Schedule appointments by linking patients with doctors on specific dates and times.
4. **Billing System:**
 - Create bills based on the patient's treatment or consultation.

5. Reports:

- Generate a list of appointments by date.
- Create a report showing all outstanding bills.

❖ Database Design (ERD):

1. **One-to-many relationship** between **Patient** and **Appointment** (a patient can have multiple appointments).
2. **One-to-many relationship** between **Doctor** and **Appointment** (a doctor can have multiple appointments).
3. **One-to-many relationship** between **Patient** and **Billing** (a patient can have multiple bills).
